In the Claims

Please amend the claims as follows and cancel claim 28 without prejudice.

1. (Original) An output stage for providing a substantially symmetrical rail-to-rail output voltage, the output stage comprising:

a first field effect device having a first source, first drain, and first gate, the first source being coupled to a power supply V_{CC};

a second field effect device complementary to the first field effect device, wherein the second field effect device includes a second source, second drain, and second gate, and wherein the second source is coupled to a power supply having a nominal voltage supply of V_{EE} and wherein the second drain is coupled to the first drain; and

an output sink network coupled to the second gate, wherein the output sink network drives the second field effect device such that a product of a first current in the first field effect device and a second current in the second field effect device is substantially equal to a predetermined constant.

2. (Original) An output stage as recited in claim 1, wherein a sum of the first current and the second current is essentially equal to a predetermined constant during operation of the output stage.

3. (Original) An output stage as recited in claim 1, wherein the first field effect device is configured in a common source configuration.

4. (Original) An output stage as recited in claim 1, wherein the first field effect device is a P-channel metal oxide semiconductor field effect (PMOS) transistor.

5. (Original) An output stage as recited in claim 4, wherein the second field effect device is an N-channel metal oxide semiconductor field effect (NMOS) transistor.

6. (Original) An output stage as recited in claim 5, wherein the output sink network utilizes a current mirror to track the current in the first field effect device.

7. (Currently amended) An output stage as recited in claim 6, wherein the current mirror tracks the current in the first field effect device at a predetermined ratio of the current in the first field effect device.

8. (Original) An output stage as recited in claim 1, wherein the first field effect device is an N-channel metal oxide semiconductor field effect (NMOS) transistor.

9. (Original) An output stage as recited in claim 8, wherein the second field effect device is a P-channel metal oxide semiconductor field effect (PMOS) transistor.

10. (Original) An output stage as recited in claim 1, wherein a substantially rail-to-rail output voltage produced by the output stage is no more than one V_{GS} and two V_{Dsat} from either rail.

11. (Original) A method for providing an output signal from an output stage of a low voltage operation amplifier capable of providing a substantially rail-to-rail output voltage, the method comprising the operations of:

providing an input signal to a first field effect device having a first source, first drain, and first gate, the first source being coupled to a power supply V_{CC}; and

driving a second complimentary field effect device utilizing an output sink network such that a product of a first current in the first field effect device and a second current in the second field effect device is substantially equal to a predetermined constant.

12. (Original) A method as recited in claim 11, wherein a sum of the first current and the second current is essentially equal to a predetermined constant during operation of the amplifier.

13. (Original) A method as recited in claim 11, wherein the first field effect device is configured in a common source configuration.

14. (Original) A method as recited in claim 13, wherein the first field effect device is a P-channel metal oxide semiconductor field effect (PMOS) transistor.

15. (Original) A method as recited in claim 14, wherein the second field effect device is an N-channel metal oxide semiconductor field effect (NMOS) transistor.

16. (Original) A method as recited in claim 15, further comprising the operation of tracking the current in the first field effect device utilizing a current mirror.

17. (Original) A method as recited in claim 16, wherein the cur-rent mirror tracks the current in the first field effect device at a predetermined ratio.

18. (Original) A method as recited in claim 11, further comprising the operation of producing an essentially rail-to-rail output voltage, the essentially rail-to-rail output voltage being no more than one V_{GS} and two V_{Dsat} from either rail.

19. (Original) An application specific integrated circuit (ASIC) having an output stage for a low voltage operational amplifier, the ASIC comprising:

a first field effect device having a first source, first drain, and first gate, the first source being coupled to a power supply V_{CC};

a second field effect device complementary to the first field effect device, wherein the second field effect device includes a second source, second drain, and second gate, and wherein the second source is coupled to a power supply having a nominal voltage supply of V_{EE} and wherein the second drain is coupled to the first drain; and

an output sink network coupled to the second gate, wherein the output sink network drives the second field effect device such that a product of a first current in the first field effect device and a second current in the second field effect device is essentially equal to a predetermined constant during operation of the output stage.

20. (Original) An ASIC as recited in claim 19, wherein the first field effect device is configured in a common source configuration.

21. (Original) An ASIC as recited in claim 19, wherein the first field effect device is a P-channel metal oxide semiconductor field effect (PMOS) transistor.

22. (Original) An ASIC as recited in claim 21, wherein the second field effect device is an N-channel metal oxide semiconductor field effect (NMOS) transistor.

23. (Original) An ASIC as recited in claim 22, wherein the output sink network utilizes a current mirror to track the current in the first field effect device.

24. (Currently) An ASIC as recited in claim 23, wherein the current mirror tracks the current in the first field effect device at a predetermined ratio.[A method as recited in claim 13, wherein the current mirror tracks the current in the first field effect device at a predetermined ratio.]

25. (Original) An ASIC as recited in claim 24, wherein the predetermined ratio is about 6:1.

26. (Original) An ASIC as recited in claim 19, wherein a substantially rail-to-rail output voltage produced by the output stage is no more than one V_{GS} and two V_{Dsat} from either rail.

27. (Currently amended) An operational amplifier output stage suitable for low voltage operation and capable of providing a substantially rail-to-rail output voltage, the output stage comprising:

a push-pull output network, wherein the push-pull output network receives a first input signal and a second input signal, the first input signal being provided by an input signal V_{IN}; and

an output sink network, wherein the output sink network provides the second input signal to the push-pull output network, wherein the push-pull output network includes a first field effect device and a second complimentary field effect device, driven by the output sink network, such that a product of a first current in the first field effect device and a second current in the second field effect device is substantially equal to a predetermined constant.

28. (Canceled)

29. (Currently amended) An operational amplifier output stage as recited in claim [28]27, wherein the first field effect device is configured in a common source configuration.

30. (Original) An operational amplifier output stage as recited in claim 29, wherein the output sink network utilizes a current mirror to track the current in the first field effect device.

31. (Original) An operational amplifier output stage as recited in claim 30, wherein the current mirror tracks the current in the first field effect device at a predetermined ratio.

32. (Currently amended) An operational amplifier suitable for operating on low input voltages and capable of providing a substantially symmetrical rail-to-rail output voltage, the operational amplifier comprising:

an input stage; and

an output stage coupled to the input stage, wherein the output stage includes an output sink network, and wherein the output stage also includes a first field effect device, and a second field effect device, driven by the output sink network, such that a product of a first current in the first field effect device and a second current in the second field effect device is substantially equal to a predetermined constant.

33. (Original) An operational amplifier as recited in claim 32, wherein the output stage further includes a push-pull output network, wherein the push-pull output network receives a first

input signal and a second input signal, the first input signal being provided by an input signal V_{IN}.

34. (Original) An operational amplifier as recited in claim 33, wherein the output sink network provides the second input signal to the push-pull output network.
